BoC QT: Chapter 1

By Warren Lovely & Taylor Schleich

With mid-year just around the corner, the first official quarter of Bank of Canada Quantitative Tightening (QT) is nearly complete. Think of this as ‘Chapter 1’ in what—at least in an ideal, still-growing world—is meant to be a lengthy balance sheet reduction book. You could just as well label the last couple of months a ‘preface’ to the more significant (albeit passive) GoC bond run-offs coming our way over the coming months/quarters. But let’s set the literary analogy aside and get to the main points, of which there are four:

So far, so good? (In a sense, yes) ➳ While the last Bank of Canada purchase settled April 25th, the central bank’s holdings of GoC bonds technically peaked in late 2021/early 2022. In a sense then, QT produced the first tentative net reduction in BoC bond ownership, with holdings dropping more noticeably in Q2. So we’re now at the stage where end investors, rather than the monetary authority, comprise the market-clearing flow. Canada’s admittedly stale national balance sheet data (with data to March out recently) show a host of domestic investor types have begun to step into the BoC’s vacuum. And at least through April (the latest data print available), non-residents had remained net buyers of GoC bonds, even if their year-to-date purchase pace had moderated vs. the year-earlier period.

Reduced domestic bond supply a happy coincidence ➳ While the restoration of end-investor participation in the GoC market is just getting going, it certainly helps that the federal government’s funding needs are stepping down at the same time… perhaps appreciably. Notwithstanding a recent stumble, still-lofty commodity prices have buoyed Canada’s terms-of-trade and by extension nominal GDP. That in turn has seen bonus/unplanned revenue pour into government coffers. What does an improving fiscal position mean for borrowing? Rather than solely cutting the T-bill stock (the traditional financial shock absorber), Ottawa’s bonus cash means fewer bonds too. Ultra-long bonds were recently canceled and further adjustments to the bond program can be expected. QT then meets with reduced GoC bond supply… perfect timing. We hasten to add that provincial government borrowing requirements have also receded (in some cases significantly), further lessening public sector supply anxiety in the domestic market.

QT impacts (so far) hard to isolate & clearly dwarfed by major re-think on policy rates ➳ As it stands, you would have a hard time defining a statistically significant ‘QT impact’ on term premia and/or yield differentials. After all, it’s still early days for the BoC, while the Fed is only now getting its own QT initiative off the ground. At present, movements in bond yields, curves, flies and cross-market levels—to say nothing of the generalized deterioration in financial conditions, equities and credit spreads—are more clearly a function of absolute and relative policy rate expectations, which themselves remain fluid. Assuming rapid-fire rate hikes don’t totally derail the expansion and the monetary policy focus shifts more fully to balance sheet management in 2023, we might then be able to more clearly isolate the liquidity draining effects of BoC and Fed QT programmes. But we need to survive at least a few more rounds of aggressive rate hikes first.

The real test lies ahead ➳ As we turn the page on ’Chapter 1’, fair to say that there are many more chapters/volumes yet to be written. The BoC has C$92 billion of GoC bonds running off its sheet in the next 12 months alone and fully C$170 billion maturing over the coming two years. The Fed, as noted, is just getting started on QT and will remain in a notional ‘ramp-up phase’ until September. But at $95 billion in run-off per month thereafter, the Fed would be slashing over a trillion dollars from its balance sheet on an annualized basis. As we saw during the Fed’s inaugural QT foray, there comes a point (i.e., a pain threshold) where things start to break down. Of course, as both Macklem and Powell might be willing to concede, identifying the breaking point may not even be possible. So even if the opening pages were a bit dull/less-than-shocking, this QT book could yet prove hard to put down.

Chart 1: BoC past the peak on asset and GoC holdings...

Bank of Canada total assets & holdings of GoC bonds: Weekly

Technically, the BoC’s balance sheet peaked in early 2021, when it was still flush with repos and other short-term assets. But the focus has really been on their GoC holdings. As purchases here wound down over the course of 2021, GoC holdings hit a crescendo north of $400 bln. Starting in April, all purchases ceased, and we’re thus seeing holdings move down. This is just the beginning.
Garnering much attention last year was the BoC’s soaring ownership share of the GoC market, bounding comfortably above 40%. Net purchases by foreigners weren’t significantly cannibalized by the BoC, but relative domestic ownership plunged. Now, with the BoC vacating the market, end investors are solely tasked with supply absorption. It’s meant to be that way for a few years at least.

Through Q1, before QT had officially begun, we’d started to see the return of domestic investors to the GoC market. While non-resident demand is always welcomed, it can be a double-edged sword as foreign flows can leave just as quickly as they come. With the BoC sidelined, we’ll be increasingly relying on Canadian institutions to absorb a still-elevated (yet rapidly declining) issuance profile.
Market View
Economics and Strategy

Conventional wisdom would suggest that the curve should steepen during QT, as the central bank adds duration to the market. That may be true in a vacuum but the current environment, driven by a rapidly evolving policy rate outlook, is clearly the driving force of curve structure today. While Canadas have underperformed US T’s since QT started, we credit that to a relative policy rate re-think.

QT, on its own, hasn’t been a disaster for Canadian credit. Although wider, provincial credit spreads have registered notable outperformance vs. key US comps. Again, we believe fiscal fundamentals and related supply technicals (still immensely positive for many Canadian governments) can blunt QT impacts. And at least for now, there’s still excess liquidity sloshing in the system. Could be worse.
This Report was prepared by National Bank Financial, Inc. (NBF), (a Canadian investment dealer, member of IIROC), an indirect wholly owned subsidiary of National Bank of Canada. National Bank of Canada is a public company listed on the Toronto Stock Exchange.

The particulars contained herein were obtained from sources which we believe to be reliable but are not guaranteed by us and may be incomplete and may be subject to change without notice.
